

二、相关函数的比较

$$f_1(t) * f_2(t) = \int_{-\infty}^{\infty} f_1(\tau) f_2(t-\tau) d\tau$$

$$R_{11}(T) = \int_{-\infty}^{\infty} f_1(t) f_1(t-T) dt \Rightarrow \text{Parseval: } \int_{-\infty}^{\infty} R_{11}(T) e^{-j\omega T} dT$$

$$R_{12}(T) = f_1(t) * f_2(-T)$$

自相关函数为偶函数 $R(t) = R(-t)$

周期信号自相关函数仍为周期信号, 周期相同

三、相关定理

若已知 $F[f_1(t)] = F_1(\omega)$ $F[f_2(t)] = F_2(\omega)$

$$\text{则 } F[R_{11}(T)] = F_1(\omega) \cdot F_1^*(\omega) \quad F[R_{12}(T)] = F_1(\omega) \cdot F_2^*(\omega)$$

若 $f_1(t) = f_2(t) = f(t)$, $F[f(t)] = F(\omega)$

$$\text{则 } F[R_{11}(T)] = |F(\omega)|^2$$

$$R_{11}(T) = \int_{-\infty}^{\infty} f_1(t) f_1^*(t-T) dt$$

$$F[R_{11}(T)] = \int_{-\infty}^{\infty} R_{11}(T) e^{-j\omega T} dT$$

$$= \int_{-\infty}^{\infty} \left[\int_{-\infty}^{\infty} f_1(t) f_1^*(t-T) dt \right] e^{-j\omega T} dT$$

$$= \int_{-\infty}^{\infty} f_1(t) \left[\int_{-\infty}^{\infty} f_1^*(t-T) e^{-j\omega T} dT \right] dt$$

$$\text{令 } u = t - T \quad R(T) = f_1(t) \int_{-\infty}^{\infty} f_1^*(u) e^{-j\omega u} du$$

$$\int_{-\infty}^{\infty} f_1^*(t-T) e^{-j\omega T} dT = \int_{-\infty}^{\infty} f_1^*(u) e^{-j\omega u} du$$

$$= e^{-j\omega u} \int_{-\infty}^{\infty} f_1^*(u) e^{j\omega u} du = e^{-j\omega u} \left[\int_{-\infty}^{\infty} f_1(u) e^{-j\omega u} du \right]^*$$

$$= e^{-j\omega u} F_1^*(\omega)$$

$$= \int_{-\infty}^{\infty} f_1(t) F_1^*(\omega) e^{-j\omega t} dt$$

$$= F_1(\omega) \cdot F_1^*(\omega)$$

§6.5 能量谱与功率谱

一、能量谱

$$F[R_{11}(T)] = |F(\omega)|^2$$

$$\Rightarrow R_{11}(T) = \frac{1}{2\pi} \int_{-\infty}^{\infty} |F(\omega)|^2 e^{j\omega T} d\omega$$

能量有限信号的相关函数是:

$$R_{11}(T) = \int_{-\infty}^{\infty} f_1(t) f_1^*(t-T) dt$$

$$R_{11}(0) = \int_{-\infty}^{\infty} |f_1(t)|^2 dt$$

$$\Rightarrow R_{11}(0) = \int_{-\infty}^{\infty} |f_1(t)|^2 dt = \frac{1}{2\pi} \int_{-\infty}^{\infty} |F(\omega)|^2 d\omega \stackrel{\text{Parseval}}{=} \int_{-\infty}^{\infty} |F(\omega)|^2 d\omega$$

$$\text{能量谱密度(能量谱)} = E(\omega) = |F(\omega)|^2$$

$$E(\omega) = F[R_{11}(T)]$$

$$R_{11}(T) = F^{-1}[E(\omega)]$$

二、功率谱

$$\text{令 } f_1(t) = \begin{cases} f(t) & |t| \leq T \\ 0 & |t| > T \end{cases}$$

T 是有限的, 能量有限

$$F[f_1(t)] = F_T(\omega)$$

$$E_T = \int_{-\infty}^{\infty} f_1^2(t) dt = \frac{1}{2\pi} \int_{-\infty}^{\infty} |F_T(\omega)|^2 d\omega$$

$$\Rightarrow \int_{-\infty}^{\infty} f_1^2(t) dt$$

$$\text{则求平均功率: } P = \lim_{T \rightarrow \infty} \frac{1}{T} \int_{-\infty}^{\infty} f_1^2(t) dt = \frac{1}{2\pi} \lim_{T \rightarrow \infty} \int_{-\infty}^{\infty} \frac{|F_T(\omega)|^2}{T} d\omega$$

$$\text{求功率谱密度函数(功率谱): } P(\omega) = \lim_{T \rightarrow \infty} \frac{|F_T(\omega)|^2}{T}$$

$$P = \frac{1}{2\pi} \int_{-\infty}^{\infty} P(\omega) d\omega$$

$$R_{11}(T) = \lim_{T \rightarrow \infty} \frac{1}{T} \int_{-\infty}^{\infty} f_1(t) f_1^*(t-T) dt$$

$$\int_{-\infty}^{\infty} f_1(t) f_1^*(t-T) dt = \frac{1}{2\pi} \int_{-\infty}^{\infty} |F_T(\omega)|^2 e^{j\omega T} d\omega$$

$$P(\omega) = \lim_{T \rightarrow \infty} \frac{|F_T(\omega)|^2}{T}$$

$$R_{11}(T) = \frac{1}{2\pi} \int_{-\infty}^{\infty} P(\omega) e^{j\omega T} d\omega$$

$$P(\omega) = \int_{-\infty}^{\infty} R_{11}(T) e^{-j\omega T} dT$$

$$P(\omega) = F[R_{11}(T)]$$

$$R_{11}(T) = F^{-1}[P(\omega)]$$

$$P = \lim_{T \rightarrow \infty} \frac{1}{T} \int_{-\infty}^{\infty} f_1^2(t) dt$$

$$= \frac{1}{2\pi} \int_{-\infty}^{\infty} \lim_{T \rightarrow \infty} \frac{|F_T(\omega)|^2}{T} d\omega$$

$$= \frac{1}{2\pi} \int_{-\infty}^{\infty} P(\omega) d\omega$$

维纳-欣钦关系

$$\text{能量信号} \quad R_{11}(T) = \int_{-\infty}^{\infty} f_1(t) f_1^*(t-T) dt$$

$$E(\omega) = |F(\omega)|^2$$

$$R_{11}(T) \Leftrightarrow E(\omega)$$

$$\text{功率信号} \quad R_{11}(T) = \lim_{T \rightarrow \infty} \frac{1}{T} \int_{-\infty}^{\infty} f_1(t) f_1^*(t-T) dt$$

$$P(\omega) = \lim_{T \rightarrow \infty} \frac{|F_T(\omega)|^2}{T}$$

$$R_{11}(T) \Leftrightarrow P(\omega)$$

§6.6 信号通过线性系统的自相关函数、能量谱和功率谱分析

一、能量谱和功率谱分析

$$\text{时域: } R(t) = h(t) * E(t)$$

$$\text{频域: } R(j\omega) = H(j\omega) E(j\omega)$$

假定 $E(t)$ 是能量有限信号, $E(t)$ 的能量谱密度为 $E(\omega)$

$R(t)$ 的能量谱密度为 $E_R(\omega)$

$$E(\omega) = |E(j\omega)|^2 \quad E_R(\omega) = |R(j\omega)|^2$$

$$|R(j\omega)|^2 = |H(j\omega)|^2 |E(j\omega)|^2$$

$$E_R(\omega) = |H(j\omega)|^2 E(\omega)$$

$$P_R(\omega) = |H(j\omega)|^2 P(\omega)$$

$$P_R(\omega) = |H(j\omega)|^2 P(\omega)$$

$$P_R(\omega) = |H(j\omega)|^2 P(\omega)$$

二、信号经线性系统的时域函数

$$E_R(t) = |H(j\omega)|^2 E(\omega) = H(j\omega) H^*(j\omega) E(\omega)$$

$$P_R(\omega) = |H(j\omega)|^2 P(\omega) = H(j\omega) H^*(j\omega) P(\omega)$$

$$F[f_1(t) * f_2(t)] = \int_{-\infty}^{\infty} f_1(t) f_2(t) e^{-j\omega t} dt = \left[\int_{-\infty}^{\infty} f_1(t) e^{-j\omega t} dt \right] \left[\int_{-\infty}^{\infty} f_2(t) e^{-j\omega t} dt \right]^* = F_1(\omega) F_2^*(\omega)$$

$$\text{系统冲激响应自相关函数 } R_{11}(T) = h(t) * h^*(t-T)$$

$$\text{输出相关函数满足卷积: } R_{11}(T) = R_{11}(T) * R_{11}(T)$$

例: 功率谱密度为 N 的白噪声通过图示 RC 低通网络, 求输出的功率谱 $S_{11}(\omega)$ 及自相关函数 $R_{11}(T)$, 并求输出的平均功率 P_R .

冲激响应: $h(t) = F^{-1}[H(j\omega)] = \frac{1}{\sqrt{2\pi}} e^{-\frac{1}{2RC}t} u(t)$

1) 噪声功率谱为:

$$P_{n1}(f) = P_{n1}(f) |H(j\omega)|^2 = \frac{N}{1 + \omega^2 RC^2}$$

2) 相关函数

$$R_{n1}(\tau) = F^{-1}[P_{n1}(j\omega)] = F^{-1}\left[\frac{N}{1 + \omega^2 RC^2}\right]$$

$$R_{n1}(\tau) = R_{n1}(\tau) * h(\tau) * h(\tau) \\ = \frac{N}{2RC} e^{-\frac{1}{2RC}|\tau|}$$

$$\text{③ 法2: } R_{n1}(\tau) = F^{-1}[P_{n1}(j\omega)] = F^{-1}\left[\frac{N}{1 + \omega^2 RC^2}\right]$$

$$F[e^{-a|t|}] = \frac{2a}{a^2 + \omega^2}$$

3) 求输出的平均功率:

$$\text{功率谱 } P_{n1}(f) = N \frac{1}{1 + \omega^2 RC^2}$$

$$P_r = \frac{1}{2\pi} \int_{-\infty}^{\infty} P_{n1}(j\omega) d\omega = \frac{N}{2RC}$$

§6.7 匹配滤波器

一、定义: 指滤波器的性能对信号的特性取得某种一致, 使滤波器输出端的信号瞬时功率与噪声平均功率的比值最大

二、匹配滤波器的设计

在 $t = t_m$ 时刻信噪比 $\rho = \frac{S_o(t_m)}{n_o(t_m)}$

设 $s_1(j\omega) = F[S_1(t)]$, 则

$$S_o(t) = F^{-1}[S_1(j\omega) H(j\omega)] = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} H(j\omega) S_1(j\omega) e^{j\omega t} d\omega$$

$n(t)$ 是白噪声, 其功率谱为常数 N , 则 $n_o(t)$ 的功率谱为: $|H(j\omega)|^2 N$

$$\overline{n_o^2(t)} = \frac{1}{2\pi} \int_{-\infty}^{\infty} N |H(j\omega)|^2 d\omega = P \quad \text{噪声的平均功率}$$

$$\overline{n_o^2(t)} \leq \overline{n_o^2(t_m)} \quad \text{且此值与时间 } t \text{ 无关, 则 } \overline{n_o^2(t_m)} = \frac{N}{2\pi} \int_{-\infty}^{\infty} |H(j\omega)|^2 d\omega$$

$$\rho = \frac{S_o(t_m)}{\overline{n_o^2(t_m)}} = \frac{| \int_{-\infty}^{\infty} H(j\omega) S_1(j\omega) e^{j\omega t_m} d\omega |^2}{2\pi N \int_{-\infty}^{\infty} |H(j\omega)|^2 d\omega} \leq \frac{[\int_{-\infty}^{\infty} |H(j\omega)|^2 d\omega \int_{-\infty}^{\infty} |S_1(j\omega)|^2 d\omega]}{2\pi N \int_{-\infty}^{\infty} |H(j\omega)|^2 d\omega} = \frac{\int_{-\infty}^{\infty} |S_1(j\omega)|^2 d\omega}{2\pi N}$$

匹配滤波器的约束关系: $H(j\omega) = K S_1^*(j\omega) e^{-j\omega t_m}$

冲激响应为: $h(t) = F^{-1}[H(j\omega)] = K S_1^*(t - t_m)$

三、证明:

1、匹配滤波器的功能相当于对 $s(t)$ 进行自相关运算。

$$S_o(t) = s(t) * h(t) = s(t) * S_1^*(t - t_m) = \int_{-\infty}^{\infty} s(t - \tau) S_1^*(t - \tau - t_m) d\tau = R_{ss}(t - t_m)$$

2、匹配滤波器输出信号的最大值在 $t = T$ 处, 其大小等于 $S_1(t)$ 的能量 E , 与 $S_1(t)$ 波形无关

$$t = t_m = T \quad S_o(t_m) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} H(j\omega) S_1(j\omega) e^{j\omega T} d\omega$$

$$H(j\omega) = K S_1^*(j\omega) e^{-j\omega T}$$

$$S_o(t_m) = S_o(T) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} |S_1(j\omega)|^2 d\omega$$

$$\therefore S_o(T) = R_{ss}(T - T)$$

$$\therefore S_o(T) = \int_{-\infty}^{\infty} S_1^*(\tau) S_1(\tau) d\tau$$

$$\therefore S_o(T) = \int_{-\infty}^{\infty} S_1^*(\tau) S_1(\tau) d\tau = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} |S_1(j\omega)|^2 d\omega = E = R_{ss}(0)$$

$$S_o(t) = S_1(t) * h(t) = S_1(t) * S_1^*(t - T) = \int_{-\infty}^{\infty} S_1(\tau) S_1^*(\tau - (t - T)) d\tau = R_{ss}(t - T)$$

$$R_{ss}(t) = \int_{-\infty}^{\infty} f_1(\tau) f_1^*(\tau - t) d\tau$$

$$R_{ss}(t - T) = \int_{-\infty}^{\infty} f_1(\tau) f_1^*(\tau - (t - T)) d\tau$$

§6.8 码分复用、码分多址(CDMA)通信

利用一组正交码序列来区分各路信号

$$[g_1(t) \cos(\omega_c t) + g_2(t) \sin(\omega_c t)] \cos(\omega_c t)$$

$$= \frac{1}{2} g_1(t) [1 + \cos(2\omega_c t)] + \frac{1}{2} g_2(t) \sin(2\omega_c t)$$

低通滤波器滤除高频信号

$$\frac{1}{2} g_1(t)$$

课堂练习 某线性非时变系统的幅频响应 $|H(j\omega)|$ 和相频响应 $\varphi(\omega)$ 如图所

示。若激励 $f(t) = 1 + \sum_{n=1}^{\infty} \frac{1}{n} \cos nt$ ，求该系统的响应 $y(t)$ 。

解: $f(t) = 1 + \sum_{n=1}^{\infty} \frac{1}{n} \cos nt$

$$= 1 + \cos t + \frac{1}{2} \cos 2t + \dots$$

$$F(j\omega) = 2\pi\delta(\omega) + \dots$$

$$+ \pi[\delta(\omega+1) + \delta(\omega-1)]$$

$$+ \frac{1}{2} \pi[\delta(\omega+2) + \delta(\omega-2)] + \dots$$

该信号通过系统后，其响应的频谱为：

$$Y(j\omega) = H(j\omega)F(j\omega) = |H(j\omega)|F(j\omega)e^{j\varphi(\omega)}$$

$$= 4\pi\delta(\omega) + \pi[\delta(\omega+1) + \delta(\omega-1)]e^{-j\frac{\pi}{2}\omega}$$

$$\text{傅里叶反变换可得: } y(t) = 2 + \cos(t - \frac{\pi}{2}) = 2 + \sin t$$

傅里叶变换和傅里叶反变换的过程可以省略！

有效分量 $\times |H(j\omega)| \cdot e^{j\varphi(\omega)}$

$$\begin{aligned} & \text{ACOS } u_{GT} \\ & \downarrow \\ & H(j\omega) = |H(j\omega)| e^{j\varphi} \\ & \leftarrow \text{GAIN} \quad \text{PHASE} \end{aligned}$$

$$|H(j\omega)| \cos(\omega t + \varphi_0)$$

例4 RC电路，若输入信号为周期矩形脉冲波如下图所示。求系统响应。

非正弦(谐波)周期信号

$$\begin{aligned} & 2\pi\delta(\omega - n\Omega) \xrightarrow{H(j\omega)} 2\pi H(jn\Omega) \delta(\omega - n\Omega) \\ & \uparrow \quad \quad \quad \uparrow \\ & e^{jn\Omega t} \quad \quad \quad H(j\omega) \quad \quad \quad H(jn\Omega) e^{jn\Omega t} \\ & f(t) = \sum_{n=-\infty}^{\infty} F_n e^{jn\Omega t} \xrightarrow{H(j\omega)} y(t) = \sum_{n=-\infty}^{\infty} H(jn\Omega) F_n e^{jn\Omega t} \end{aligned}$$

$$\Omega = \frac{2\pi}{T} \text{ (角频率)}$$

在一个周期 $[-\frac{T}{2}, \frac{T}{2}]$ 内, $f(t) = \begin{cases} E, & |t| < \frac{T}{2} \\ 0, & \frac{T}{2} < |t| < \frac{T}{2} \end{cases}$

傅里叶级数公式

$$F_n = \frac{1}{T} \int_{-\frac{T}{2}}^{\frac{T}{2}} f(t) e^{-jn\Omega t} dt$$

$$= \frac{E}{T} \int_{-\frac{T}{2}}^{\frac{T}{2}} e^{-jn\Omega t} dt$$

$$= \frac{E}{nT\Omega} (e^{-j\frac{n\Omega T}{2}} - e^{j\frac{n\Omega T}{2}})$$

$$= \frac{2E}{nT\Omega} \sin(\frac{n\Omega T}{2})$$

$$= \frac{ET}{T} \text{Sa}(\frac{n\Omega T}{2})$$

该题 $E=1, T=1, \Omega=2\pi$

$$F_n = \frac{1}{2} \text{Sa}(\frac{n\Omega}{2}), n \in \mathbb{Z} \Rightarrow f(t) = \sum_{n=-\infty}^{\infty} \frac{1}{2} \text{Sa}(\frac{n\Omega}{2}) e^{jn\Omega t}$$

$$\text{RC电路: } H(j\omega) = \frac{1}{R + j\omega C} = \frac{1}{1 + j\omega RC}$$

$$H(jn\Omega) = H(jn\pi) = \frac{1}{1 + jn\pi RC}$$

$$y(t) = \sum_{n=-\infty}^{\infty} \frac{1}{1 + jn\pi RC} \cdot \frac{1}{2} \text{Sa}(\frac{n\Omega}{2}) e^{jn\Omega t}$$

例1: 在测距系统中, 发送信号 $s(t)$, 以匹配滤波器接收回波信号, 利用滤波器输出信号峰值出现的时间折算目标距离。如果有两种可供选择的信号 $s(t)$, 分别如图(a)的 $s_1(t)$, 和图(b)的 $s_2(t)$ 。

(a)

(b)

求:
(1) 分别画出 $s_1(t)$ 和 $s_2(t)$ 自相关函数波形 $R_{11}(t)$ 和 $R_{22}(t)$;

$$R_{11}(t) = s_1(t) * s_1(-t) = \int_{-\infty}^{\infty} s_1(\tau) s_1(\tau - t) d\tau$$

$$|t| > 2 \Rightarrow R_{11}(t) = 0$$

$$|t| < 2 \Rightarrow R_{11}(t) = |t|$$

$$R_{22}(t) = \int_{-\infty}^{\infty} s_2(\tau) s_2(\tau - t) d\tau$$

$$|t| > 2 \Rightarrow 0$$

$$|t| < 1 \Rightarrow 2 - |t|$$

$$1 < |t| < 2 \Rightarrow |t| - 2$$

→ 选用 $s_2(t)$ 脉冲信号

(选用相关函数形状为尖脉冲信号, 改善测量精度)
