

多元函数微分学

一、区域:

1. 邻域

点集 $U(P_0, \delta) = \{P \mid |PP_0| < \delta\}$ 称为点 P_0 的 δ 邻域

平面: $U(P_0, \delta) = \{(x, y) \mid \sqrt{(x-x_0)^2 + (y-y_0)^2} < \delta\}$ (圆邻域)

空间: $U(P_0, \delta) = \{(x, y, z) \mid \sqrt{(x-x_0)^2 + (y-y_0)^2 + (z-z_0)^2} < \delta\}$ (球邻域)

不强调 δ , 记为 $U(P)$, 不包括点 P 则记为 $\dot{U}(P, \delta)$

2 平面点集

(1) 内点, 外点, 边界点

若存在点 P 的某邻域 $U(P) \subset E$, 则称 P 为 E 的内点,

若存在点 P 的某邻域 $U(P) \cap E = \emptyset$, 则称 P 为 E 的外点,

若 P 的任一邻域均有内点和外点, 则称 P 为 E 的边界点,

边界为实线则边界点属于 E , 边界为虚线则边界点不属于 E

(2) 聚点: 任一邻域都存在属于 E 的点.

(3) 开区域与闭区域: 开区域连同其边界

↓
任何两点可用全在 E 内的折线连接

二、极限

1. 定义: 设元函数 $f(P)$, $P \in D \subset \mathbb{R}^n$, P_0 是 D 的聚点. 若存在常数 A , 对任意正数 ϵ , 总存在正数 δ , 对一切 $P \in D \cap \dot{U}(P_0, \delta)$ 都有 $|f(P) - A| < \epsilon$, 则称 A 为函数 $f(P)$ 当 $P \rightarrow P_0$ 时的极限

记作 $\lim_{p \rightarrow p_0} f(p) = A$ (也称为 n 重极限)

当 $n=2$ 时记 $p = (p_1, p_2) = \sqrt{(x-x_0)^2 + (y-y_0)^2}$

二元函数的极限可写作: $\lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y) = A = \lim_{x \rightarrow x_0} \lim_{y \rightarrow y_0} f(x,y) = A$

2. 若当 $p(x,y)$ 以不同方式趋于 $p_0(x_0,y_0)$ 时, 函数趋于不同值或有的极限不存在, 则可以断定极限不存在

Eg: 讨论 $\lim_{(x,y) \rightarrow (0,0)} \frac{xy}{x^2+y^2}$ 的情况 → 齐次结构! 用直线!

$$\text{令 } y = kx \quad \lim_{x \rightarrow 0} \frac{kx^2}{x^2 + k^2x^2} = \frac{k}{k^2 + 1}$$

k 不同取值不同, 不存在

Eg: $\lim_{(x,y) \rightarrow (0,0)} x \frac{\ln(1+xy)}{x+y}$ → 分子次数高于分母! 用曲线! 是否存在 不存在

$$\lim_{\substack{x \rightarrow 0 \\ y = -x + x^u}} x \frac{\ln(1+xy)}{x+y} = \lim_{x \rightarrow 0} \frac{x^{2+u} - x^3}{x^u} = \lim_{x \rightarrow 0} (x^2 - x^{3-u}) = \begin{cases} \infty, & u > 3 \\ -1, & u = 3 \\ 0, & u < 3 \end{cases}$$

用于证明二元函数极限不存在

3. 二重极限 $\lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y)$ 与累次极限 $\lim_{x \rightarrow x_0} \lim_{y \rightarrow y_0} f(x,y)$ 及 $\lim_{y \rightarrow y_0} \lim_{x \rightarrow x_0} f(x,y)$ 不同

如果它们都存在, 则三者相等

$$\text{Eg: } \lim_{y \rightarrow 0} \lim_{x \rightarrow 0} \frac{xy}{x^2+y^2} = 0 = \lim_{x \rightarrow 0} \lim_{y \rightarrow 0} \frac{xy}{x^2+y^2}$$

三、多元函数的连续性

定义: 设 n 元函数 $f(p)$ 定义在 D 上, 聚点 $p_0 \in D$, 如果存在 $\lim_{p \rightarrow p_0} f(p) = f(p_0)$

则称 n 元函数 $f(p)$ 在点 p_0 连续, 否则称为不连续 即 p_0 为间断点.

一切多元初等函数在定义区域内连续.

定理: 若 f 在闭域 D 上连续 则

(1) $\exists K > 0$, s.t. $\|f\| \leq K$, $p \in D$ (有界性定理)

(2) f 在 D 上可取得最大值 M 及最小值 m (最值定理)

(3) 对 $\forall \mu \in [m, M]$, $\exists Q \in D$, 使 $f(Q) = \mu$ (介值定理)

四. 偏导数

定义: 设 $z = f(x, y)$ 在点 (x_0, y_0) 的某个邻域内极限 $\lim_{\Delta x \rightarrow 0} \frac{f(x_0 + \Delta x, y_0) - f(x_0, y_0)}{\Delta x}$ 存在, 则称此极限为 $z = f(x, y)$ 在

(x_0, y_0) 对 x 的偏导数, 记为: $\frac{\partial z}{\partial x} \Big|_{(x_0, y_0)}$; $\frac{\partial f}{\partial x} \Big|_{(x_0, y_0)}$; $z_x \Big|_{(x_0, y_0)}$; $f_x(x_0, y_0)$; $f'_1(x_0, y_0)$

$$f_x(x_0, y_0) \quad z = f(x, y_0) \quad f_x(x_0, y_0) = \frac{d}{dx} f(x, y_0) \Big|_{x=x_0}$$

1. 多元函数在某点偏导数存在 $\Rightarrow$ 连续

$$\text{Eg: } f(x, y) = \begin{cases} \frac{xy}{x^2+y^2}, & x^2+y^2 \neq 0 \\ 0, & x^2+y^2 = 0 \end{cases}$$

$\lim_{(x, y) \rightarrow (0, 0)} f(x, y)$ 不存在 $\Rightarrow$ 不连续

$z_x = 0, z_y = 0$ 偏导存在

2. 高阶偏导数

$$\frac{\partial}{\partial x} \left(\frac{\partial z}{\partial x} \right) = \frac{\partial^2 z}{\partial x^2} = f_{xx}(x, y)$$

$$\frac{\partial}{\partial y} \left(\frac{\partial z}{\partial x} \right) = \frac{\partial^2 z}{\partial x \partial y} = f_{xy}(x, y)$$

$$\frac{\partial}{\partial x} \left(\frac{\partial z}{\partial y} \right) = \frac{\partial^2 z}{\partial y \partial x} = f_{yx}(x, y)$$

$$\frac{\partial}{\partial y} \left(\frac{\partial z}{\partial y} \right) = \frac{\partial^2 z}{\partial y^2} = f_{yy}(x, y)$$

定理: 若 $f_{xy}(x, y)$ 和 $f_{yx}(x, y)$ 都在点 (x_0, y_0) 连续, 则 $f_{xy}(x_0, y_0) = f_{yx}(x_0, y_0)$

五. 全微分

1. 定义: 如果函数 $z = f(x, y)$ 在定义域 D 的内点 (x, y) 处全增量 $\Delta z = f(x+\Delta x, y+\Delta y) - f(x, y)$ 可表示成

$$\Delta z = A\Delta x + B\Delta y + o(\rho) \quad \rho = \sqrt{(\Delta x)^2 + (\Delta y)^2} \quad (A, B \text{ 与 } x, y \text{ 有关, 与 } \Delta x, \Delta y \text{ 无关, 则称函数 } f(x, y) \text{ 在 } (x, y) \text{ 可微, } A\Delta x + B\Delta y \text{ 称为 } f(x, y) \text{ 在点 } (x, y) \text{ 的全微分})$$

$$dz = df = A\Delta x + B\Delta y$$

2. 可微必连续

$$\lim_{\substack{\Delta x \rightarrow 0 \\ \Delta y \rightarrow 0}} \Delta z = \lim_{\substack{\Delta x \rightarrow 0 \\ \Delta y \rightarrow 0}} [A\Delta x + B\Delta y + o(\rho)] = 0$$

$$\Rightarrow \lim_{\substack{\Delta x \rightarrow 0 \\ \Delta y \rightarrow 0}} f(x+\Delta x, y+\Delta y) = f(x, y)$$

3. 可微的条件

定理1: (必要条件) 若函数 $z = f(x, y)$ 在点 (x, y) 可微, 则该函数在该点偏导数 $\frac{\partial z}{\partial x}, \frac{\partial z}{\partial y}$ 必存在, 且有

$$dz = \frac{\partial z}{\partial x} \Delta x + \frac{\partial z}{\partial y} \Delta y$$

$$\text{可微} \Rightarrow \Delta z = A\Delta x + B\Delta y + o(\rho) \quad \rho = \sqrt{(\Delta x)^2 + (\Delta y)^2}$$

$$\frac{\partial z}{\partial x} = \lim_{\Delta x \rightarrow 0} \frac{f(x+\Delta x, y) - f(x, y)}{\Delta x} \stackrel{\Delta y=0}{=} \lim_{\Delta x \rightarrow 0} \frac{A\Delta x + o(|\Delta x|)}{\Delta x} = A$$

$$\text{同理: } \frac{\partial z}{\partial y} = B$$

$$\text{则 } dz = A\Delta x + B\Delta y = \frac{\partial z}{\partial x} \Delta x + \frac{\partial z}{\partial y} \Delta y$$

$$dz = f_x(x, y)\Delta x + f_y(x, y)\Delta y$$

定理1 用于判断不可微

可微的充分必要条件:

$$z=f(x,y) \text{ 在点 } (x_0, y_0) \text{ 可微} \iff \lim_{\substack{\Delta x \rightarrow 0 \\ \Delta y \rightarrow 0}} \frac{\Delta z - [f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y]}{\rho} = 0$$

充分不必要条件:

若二元函数 $z=f(x,y)$ 在点 (x_0, y_0) 的某个领域内存在偏导数 且 $f_x(x,y), f_y(x,y)$ 在点 (x_0, y_0) 连续 $\Rightarrow$ 函数在该点可微

$$\frac{\partial z}{\partial x} \quad \frac{\partial z}{\partial y}$$

$$\Delta z = f(x+\Delta x, y+\Delta y) - f(x, y)$$

$$= f(x+\Delta x, y+\Delta y) - f(x, y+\Delta y) + f(x, y+\Delta y) - f(x, y)$$

$$= f_x(x+\theta\Delta x, y+\Delta y)\Delta x + f_y(x, y+\theta\Delta y)\Delta y \quad (0 < \theta < 1)$$

$$\lim_{\substack{\Delta x \rightarrow 0 \\ \Delta y \rightarrow 0}} f_x(x+\theta\Delta x, y+\Delta y) = f_x(x, y) \Rightarrow f_x(x+\theta\Delta x, y+\Delta y) = f_x(x, y) + o \quad \lim_{\substack{\Delta x \rightarrow 0 \\ \Delta y \rightarrow 0}} o = 0$$

$$= [f_x(x, y) + o]\Delta x + [f_y(x, y) + \beta]\Delta y$$

$$= f_x(x, y)\Delta x + f_y(x, y)\Delta y + o\Delta x + \beta\Delta y$$

$$\text{改证: } \lim_{\rho \rightarrow 0} \frac{o\Delta x + \beta\Delta y}{\rho} < |o| + |\beta| \rightarrow 0 \quad \text{从而得证}$$

$$\text{Eg: } f(x, y) = \begin{cases} \frac{1}{\sqrt{x^2+y^2}} \sin \frac{1}{\sqrt{x^2+y^2}}, & (x, y) \neq (0, 0) \\ 0, & (x, y) = (0, 0) \end{cases}$$

$f(x, y)$ 在 $(0, 0)$ 可微, 但偏导数不连续

六.多元复合函数求导法则

一元函数微分学：“链式法则”

1. 定理：若函数 $u=\varphi(t)$, $v=\psi(t)$ 在点 t 可导, $z=f(u,v)$ 在点 (u,v) 处可微, 则复合函数

$z=f(\varphi(t), \psi(t))$ 在点 t 可导, 且有链式法则

$$\frac{dz}{dt} = \frac{\partial z}{\partial u} \cdot \frac{du}{dt} + \frac{\partial z}{\partial v} \cdot \frac{dv}{dt}$$

证: $\Delta z = \frac{\partial z}{\partial u} \Delta u + \frac{\partial z}{\partial v} \Delta v + o(\rho)$, $\rho = \sqrt{(\Delta u)^2 + (\Delta v)^2}$ “连线相乘, 分线相加”

$$\lim_{\Delta t \rightarrow 0} \frac{\Delta z}{\Delta t} = \lim_{\Delta t \rightarrow 0} \left[\frac{\partial z}{\partial u} \frac{\Delta u}{\Delta t} + \frac{\partial z}{\partial v} \frac{\Delta v}{\Delta t} + \frac{o(\rho)}{\Delta t} \right]$$

$$\left(\lim_{\Delta t \rightarrow 0} \frac{o(\rho)}{\Delta t} = \lim_{\Delta t \rightarrow 0} \frac{o(\rho)/\rho}{\Delta t/\rho} \rightarrow \sqrt{\left(\frac{\Delta u}{\Delta t}\right)^2 + \left(\frac{\Delta v}{\Delta t}\right)^2} \rightarrow \sqrt{\left(\frac{du}{dt}\right)^2 + \left(\frac{dv}{dt}\right)^2} \right)$$

$$\lim_{\Delta t \rightarrow 0} \frac{\Delta z}{\Delta t} = \frac{\partial z}{\partial u} \frac{du}{dt} + \frac{\partial z}{\partial v} \frac{dv}{dt}$$

即得证

2. 中间变量是多元函数的情形

Eq: $z=f(u,v)$, $u=\varphi(x,y)$, $v=\psi(x,y)$

$$\frac{\partial z}{\partial x} = \frac{\partial z}{\partial u} \frac{\partial u}{\partial x} + \frac{\partial z}{\partial v} \frac{\partial v}{\partial x}$$

Eq: $z=f(x,v)$, $v=\psi(x,y)$

$$\frac{\partial z}{\partial x} = \frac{\partial f}{\partial x} + \frac{\partial f}{\partial v} \cdot \frac{\partial v}{\partial x}$$

最终变量

$$\frac{\partial z}{\partial y} = \frac{\partial f}{\partial v} \cdot \frac{\partial v}{\partial y}$$

Eq: $w=f(x+y+z, xy, z)$, f 具有二阶连续偏导数, 求 $\frac{\partial w}{\partial x}$, $\frac{\partial^2 w}{\partial x^2}$

$\hookrightarrow f_{12} = f_{21}$

链式法则

$$\frac{\partial w}{\partial x} = \frac{\partial w}{\partial (x+y+z)} \cdot \frac{\partial (x+y+z)}{\partial x} + \frac{\partial w}{\partial (xy+z)} \cdot \frac{\partial (xy+z)}{\partial x}$$

$$= \frac{\partial w}{\partial (x+y+z)} + yz \frac{\partial w}{\partial (xy+z)}$$

$$= f'_1 + yzf'_2$$

$$\frac{\partial^2 w}{\partial x \partial z} = \frac{\partial}{\partial z} \left(\frac{\partial w}{\partial x} \right) = f''_{11} + \underbrace{xy f''_{12}}_{f''_{12}(x+y+yz)} + y f''_{21} + yz f''_{21} + yz^2 f''_{22}$$

Eg: 设 $u = f(x, y)$ 二阶偏导数连续, 求下列表达式在极坐标下的形式 (1) $\left(\frac{\partial u}{\partial x}\right)^2 + \left(\frac{\partial u}{\partial y}\right)^2$ (2) $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2}$

$$r = \sqrt{x^2 + y^2} \quad \theta = \arctan \frac{y}{x}$$

$$\frac{\partial u}{\partial x} = \frac{\partial u}{\partial r} \cdot \frac{x}{\sqrt{x^2 + y^2}} + \frac{\partial u}{\partial \theta} \cdot \frac{-y}{x^2 + y^2}$$

$$= \frac{\partial u}{\partial r} \cdot \cos \theta - \frac{\partial u}{\partial \theta} \frac{\sin \theta}{r}$$

$$\frac{\partial^2 u}{\partial x^2} = \frac{\partial}{\partial x} \left(\frac{\partial u}{\partial x} \right) = \cos \theta \cdot \frac{\partial}{\partial r} \left(\frac{\partial u}{\partial x} \right) - \frac{\sin \theta}{r} \frac{\partial}{\partial \theta} \left(\frac{\partial u}{\partial x} \right)$$

$$= \cos \theta \frac{\partial}{\partial r} \left(\frac{\partial u}{\partial r} \cos \theta - \frac{\partial u}{\partial \theta} \frac{\sin \theta}{r} \right) - \frac{\sin \theta}{r} \frac{\partial}{\partial \theta} \left(\frac{\partial u}{\partial r} \cos \theta - \frac{\partial u}{\partial \theta} \frac{\sin \theta}{r} \right)$$

3. 一阶全微分形式的不变性

设函数 $z = f(u, v)$, $u = \varphi(x, y)$, $v = \psi(x, y)$ 都可微, 则复合函数

$z = f(\varphi(x, y), \psi(x, y))$ 的全微分为:

$$dz = \frac{\partial z}{\partial u} \frac{\partial u}{\partial x} dx + \frac{\partial z}{\partial u} \frac{\partial u}{\partial y} dy + \frac{\partial z}{\partial v} \frac{\partial v}{\partial x} dx + \frac{\partial z}{\partial v} \frac{\partial v}{\partial y} dy$$

$$= \frac{\partial z}{\partial u} du + \frac{\partial z}{\partial v} dv$$
